1 RHIS: The RHIS Full-Stack Environment

1.0.1 Key points and Value For Red Hat:

Drive consistency across partner delivery, consistency in foot print variation up to support, increase onboarding velocity, capture tribal knowledge, increase telemetry quality for lightspeed and internal AI models

1.0.2 Business Value Proposition & Strategic Use Cases

This document outlines the commercial and operational value of the **Red Hat Infrastructure Services (RHIS) Builder/Provisioner**. By automating the “DNA” of an environment from Dev to Production, we solve the two biggest hurdles in the ecosystem: **Consistency** and **Time-to-Value (TTV)**.

1.1 1. Red Hat (Internal & Field Engineering)

Target Stakeholders: Consulting Leads, Global Support, Product Engineering

Core Capabilities:

- **Homogeneous Pipeline:** Create a single code/environment definition for the entire lifecycle: Dev Test Prod Support.
- **The “Tested 100%” Deployment:** Enable consultants to deploy RHEL products directly from a laptop using pre-validated, 100% tested configurations.
- **Rapid Recreates:** Support teams can instantly repurpose hardware for 1:1 bug reproduction, drastically reducing hardware overhead.

The “Sales Pitch” (ROI):

- **Accelerated Time-to-Value:** Reduce the standard “Setup Phase” of a 4-week engagement from 5 days to 4 hours.
 - **Margin Improvement:** Fewer hours spent on “plumbing” means higher margins on fixed-price engagements or the ability to reallocate senior consultants to higher-value tasks.
 - **The “Clean Room” Service:** Sell specialized security audit environments—isolated, clean, and compliant—as a high-value professional service.
-

1.2 2. Partners (ISVs & GSIs)

Target Stakeholders: Software Vendors, Global Systems Integrators

Core Capabilities:

- **“Golden Ticket” Self-Service:** Allow partners to spin up on-demand, self-service environments for testing their products against the Red Hat stack.
- **Demo-as-Code:** Sales Engineers can trigger a “Golden Demo” button to spin up complex multi-node environments on a laptop or cloud for client presentations.
- **ZTP Lab (Zero-Touch Provisioning):** Test how partner software reacts to automated hardware provisioning (PXE/iPXE) without a physical lab.

The “Sales Pitch” (ROI):

- **Certification Kits:** Monetize “Ready for Red Hat” self-certification kits. Partners pay for the platform to validate their apps, reducing the workload on Red Hat’s certification team.
 - **Subscription Sandboxes:** GSIs can buy a subscription to provide “Upskilling Sandboxes” for their employees to learn RHEL/OpenShift in a controlled, automated environment.
-

1.3 3. Customer (Enterprise IT)

Target Stakeholders: CTO, VP of Infrastructure, DevOps Leads

Core Capabilities:

- **On-Demand Self-Service:** Provide developers a “Golden Ticket” to spin up environments without waiting for IT tickets.
- **Cloud Mobility (The Exit Strategy):** Build an environment on-prem and “re-target” that exact build to AWS, Azure, or GCP—solving the problem of cloud vendor lock-in.
- **Automated Decommissioning:** Set a Time-to-Live (TTL) for environments to automatically “reap” resources, preventing VM sprawl and wasted licensing costs.

The “Sales Pitch” (ROI):

- **Shadow IT Elimination:** By making internal provisioning faster than a personal credit card on AWS, IT regains control and security.
- **DR Assurance (CAPEX to OPEX):** Instead of paying for a “Hot Site” that sits idle, customers use RHIS to “Hydrate” a Disaster Recovery site only when needed.
- **Infrastructure-as-Code (IaC) Onramp:** Sell this as a “Turnkey IaC Platform” for customers who want to modernize but lack the internal talent to build it from scratch.

1.4 4. Strategic “Big Picture” Opportunities

Market Opportunity	The “Elevator Pitch”
Sovereign/Air-Gapped Cloud	“We provide the agility of AWS inside your disconnected, high-security bunker.”
Tech Debt Remediation	“Moving from RHEL 7 to 9 is scary. We create a ‘Parallel Twin’ of your app in RHEL 9 for zero-cost testing before you flip the switch.”
Managed Service Providers	“Standardize your entire client base on a single ‘Provisioning DNA.’ One admin can manage 1,000 servers because they are all identical.”
Regulatory Audit Button	“In Banking/Pharma, you don’t sell a server; you sell Provable Compliance . Our code <i>is</i> the audit trail.”

1.5 Technical Foundation (The “Engine”)

The value above is driven by the integration of the following assets:

- **Automation:** [RHIS-Builder](#) & [Inventory](#)
- **Management:** [RedHat_Management](#)
- **Containerized Provisioning:** [quay.io/parmstro/rhis-provisioner-9-2.5:latest](#)

Note: For a sales audience, emphasize that these tools turn **manual labor (cost)** into **software-defined assets (value)**.

2 Executive Summary: Monetizing the RHIS “Golden Ticket” Platform

Prepared for: Sales Leadership

Subject: High-Margin Revenue Streams via Software-Defined Environments

2.1 The Vision: From “Labor” to “License”

Currently, Red Hat deployments and partner integrations are bottlenecked by manual environment builds. We are moving from a **service-heavy model** (selling hours) to a **platform-centric model** (selling outcomes). The **RHIS “Golden Ticket” Platform** is the engine that allows us to sell a “Push-Button” experience for complex Red Hat ecosystems.

2.2 1. Primary Revenue Drivers (The “Why”)

2.2.1 A. Accelerated Sales Velocity (Reduce TTV)

- **The Problem:** Sales cycles stall when customers wait weeks for a Proof of Concept (PoC) or Test environment.
- **The Payoff:** With the “Golden Ticket,” we provide instant, pre-validated environments. This shortens the sales cycle by **30-50%**, allowing the team to close more deals in a single fiscal year.

2.2.2 B. High-Margin Professional Services

- **The Problem:** Manual setup eats up the first week of any consulting engagement, lowering margins.
- **The Payoff:** We sell the same 4-week engagement but automate the “Plumbing” (Day 0). Consultants focus on high-value architecture (Day 2+). This effectively **doubles the profit margin** on every consulting hour sold.

2.2.3 C. “Sovereign Cloud” in a Box (The Disconnected Market)

- **The Problem:** Defense, Intelligence, and Financial sectors can’t use public clouds for sensitive dev work.
 - **The Payoff:** We sell the RHIS platform as a **Private Environment Factory**. We aren’t just selling RHEL; we are selling an “AWS-like” experience that lives behind their firewall.
-

2.3 2. Monetization Tiers (The “How”)

Tier	Targeted Segment	Offering	Revenue Model
Partner Ready	ISVs & GSIs	Self-service “Certification Sandboxes” to test their software on RHEL 8/9.	Annual Subscription
Enterprise Core	Global 2000 IT	Internal “Developer Portal” for on-demand, compliant environments.	Tiered Licensing
Mission Critical	Gov/Defense/Health	Air-gapped, “Audit-Ready” provisioning with built-in STIG/SCAP hardening.	Premium Perpetual + Maintenance

2.4 3. Competitive Moat: “The DNA Advantage”

Unlike generic automation, our product uses a **Single Source of Truth (DNA)**.

- **Market Differentiator:** If a customer builds a Dev environment with our tool, we guarantee the Prod environment will be an exact match.
 - **The Sales Hook:** “Stop paying for ‘works on my machine’ bugs. Buy the Golden Ticket and eliminate environment drift forever.”
-

2.5 4. Immediate Business Impact

- **Eliminate Technical Debt:** Facilitates the transition from RHEL 7 to RHEL 9 by providing “Risk-Free” parallel testing environments.
- **Recurring Revenue:** Shifts the relationship from a one-time “Consulting Project” to a recurring “Platform Subscription.”
- **Partner Force Multiplier:** Allows partners to demo their products *on* Red Hat hardware effortlessly, turning their sales force into an indirect sales force for us.

This pitch deck is designed to move the conversation away from “tools and scripts” and toward **“Business Agility and Risk Mitigation.”** It targets the high-level concerns of a CIO or VP of Infrastructure: cost, speed, and compliance.

3 Pitch Deck Outline: The Enterprise Environment Factory

Subtitle: Eliminating Infrastructure Friction with the RHIS “Golden Ticket” Platform

3.1 Slide 1: The Invisible Tax on Innovation

The Hook: Most enterprises spend 70% of their time “keeping the lights on” and only 30% innovating.

- **The Problem:** Manual environment provisioning, “Environment Drift” (Dev Prod), and siloed workflows are a hidden tax on every project.
 - **The Result:** Delayed launches, security vulnerabilities, and “works on my machine” bugs that cost millions in lost developer productivity.
-

3.2 Slide 2: Introducing the “Golden Ticket” Platform

The Vision: What if infrastructure was as easy as a vending machine?

- **The Solution:** A unified, software-defined “Environment Factory” based on Red Hat Infrastructure Services (RHIS).
 - **The Value:** One “DNA” (codebase) that generates identical, compliant environments across your laptop, your data center, and your public cloud.
-

3.3 Slide 3: Capability 1 — Zero-Trust, Day-0 Compliance

The Hook: Stop fixing security after the build; bake it in.

- **Feature:** Automatic injection of OpenSCAP, CIS benchmarks, and STIG hardening during the initial build.
 - **CIO Benefit:** “Audit-Ready” infrastructure from the second it’s spun up. Reduces the risk of breaches and simplifies regulatory compliance (Banking, Health, Govt).
-

3.4 Slide 4: Capability 2 — The “Dev = Prod” Guarantee

The Hook: Eliminate the #1 cause of deployment failure: Inconsistency.

- **Feature:** Using the same containerized provisioner and inventory for every stage of the lifecycle.
 - **VP Benefit:** Deployment predictability. If it works in the “Golden Ticket” sandbox, it is guaranteed to work in Production. No more emergency Sunday night rollbacks.
-

3.5 Slide 5: Capability 3 — Hybrid Cloud & Exit Strategy

The Hook: Use the cloud, don’t be owned by it.

- **Feature:** Build once on-prem and “re-target” the build to AWS, Azure, or GCP with zero code changes.
 - **CIO Benefit:** True Cloud Mobility. You gain the leverage to move workloads based on cost or performance without being locked into a single provider’s proprietary tools.
-

3.6 Slide 6: The ROI: Turning Days into Minutes

The Hook: Time is the only resource you can't buy more of—until now.

Task	Manual Process	RHIS “Golden Ticket”	Improvement
Standard Setup	3 - 5 Days	15 Minutes	95% Faster
Security Patching	Per Instance	Global “DNA” Update	Instant
DR Hydration	24 - 48 Hours	< 1 Hour	Massive Risk Reduction

3.7 Slide 7: Use Case — The “RHEL 7 to 9” Accelerator

The Hook: Modernize your legacy debt without the fear of breaking the business.

- **The Strategy:** Use RHIS to spin up “Parallel Twins” of your existing applications in RHEL 9 environments.
- **The Benefit:** Low-cost, automated testing. Identify failures in the lab, not in production. This turns a 12-month migration into a 3-month sprint.

3.8 Slide 8: Summary — Why Now?

- **Regain Control:** Eliminate Shadow IT by providing a faster internal alternative.
- **Save Capital:** Re-purpose existing hardware instantly; stop over-provisioning for “just in case” scenarios.
- **Empower Talent:** Let your highly-paid engineers build features, not “plumbing.”

3.9 Slide 9: Call to Action

The “Pilot” Phase:

- **Step 1:** Identify one “High-Friction” project.
- **Step 2:** Deploy the RHIS Provisioner to automate that specific environment.
- **Step 3:** Measure the TTV (Time-to-Value) and scale across the enterprise.

This **Sales Cheat Sheet** is designed to give Sales the “Silver Bullets” he needs when talking to technical leaders who might be skeptical or defensive about their existing tools.

4 Sales Cheat Sheet: RHIS “Golden Ticket” Platform

The Mission: Convert technical skepticism into business “Buy-In” by focusing on ROI, Risk, and Speed.

4.1 1. The 30-Second “Elevator Pitch”

“Most companies have automation tools, but they don’t have **Environmental Integrity**. Developers spend 30% of their week troubleshooting why code works in Dev but breaks in Prod. The **Golden Ticket** platform creates a ‘Single Source of Truth’ DNA for your infrastructure. Whether it’s on a laptop, in your data center, or in the cloud, the environment is identical, compliant, and 100% Red Hat certified. We don’t just provision servers; we manufacture certainty.”

4.2 2. Overcoming Executive & Technical Objections

The Objection	What they are really saying	The Pivot (The Rebuttal)
“We already use Terraform/Ansible.”	“I don’t want to buy another tool that does the same thing.”	“Terraform is a great hammer, but it doesn’t provide the blueprint. RHIS is the Factory . We use those tools under the hood to ensure the <i>result</i> is a pre-hardened, certified Red Hat environment. We aren’t replacing your tools; we’re making them actually work at scale.”
“This sounds like too much overhead to manage.”	“My team is already overworked; I can’t give them another platform.”	“Actually, this reduces overhead. It’s containerized (<code>quay.io</code>) and lightweight. It replaces the ‘manual’ scripts your team is currently maintaining. You’re trading 1,000 custom scripts for one managed ‘DNA’ source.”
“We are moving everything to the Public Cloud.”	“On-prem infrastructure is a dying priority for us.”	“That’s exactly why you need this. The ‘Golden Ticket’ is your Cloud Exit Strategy . It builds your app environment so that it’s cloud-agnostic. You can move from AWS to Azure—or back on-prem for cost savings—without rewriting a single line of infra-code.”

The Objection	What they are really saying	The Pivot (The Rebuttal)
“We don’t have the budget right now.”	“I need to see immediate ROI to justify the spend.”	“This isn’t a ‘cost’—it’s a ‘recovery.’ How much does one hour of production downtime cost you? How much do you pay consultants to sit around waiting for hardware? This platform pays for itself by reclaiming 95% of that ‘Wait Time.’”

4.3 3. “The Discovery Questions” (Finding the Pain)

Ask these to a VP of Infrastructure to make them realize they need the product:

1. “How many days does it take for a new developer to get a fully compliant Dev environment that *exactly* matches Production?”
2. “When you have a production bug, how often is the root cause ‘Environmental Drift’ (a setting that was different in Test)?”
3. “If you had to move a critical workload from the Cloud back to your data center today for a security audit, how many weeks would that take?”
4. “What is your plan for the RHEL 7 End-of-Life migration? How are you testing those apps at scale?”

4.4 4. The “Sales Special”: Key Closing Arguments

- **“Stop Buying Hours, Start Buying Outcomes:”** Tell the customer they can stop paying Red Hat consultants to do “plumbing” and start paying them to build the future.
- **“The Insurance Policy:”** Position the platform as insurance against the RHEL 7 9 migration risks.
- **“The Talent Magnet:”** “Top-tier developers hate waiting for servers. Give them the ‘Golden Ticket’ and they’ll stay at your company because they can actually spend their time coding.”
